

# Keyholder DIY

Free step-by-step plans to build a DIY Keyholder.

## STEP 1

I started this project with a piece of PureBond Plywood! Many of you know how much Ash and I love PureBond.

After learning more about it's health benefits and how pretty it makes our projects turn out, it is our go-to when we need any kind of plywood or hardwood plywood. You can see us talking about it's benefits in this video on the [PureBondPlywood.com](http://PureBondPlywood.com) website.

We encourage you to follow PureBond on Facebook! They are always sharing great how-to projects using their product from other bloggers, as well as sharing great giveaways!

The other great thing about using PureBond is the scraps baby! I have a TON just like this one I used today just waiting to be turned into something fabulous! You can also buy hardwood plywood in 2'x4' pieces.

For the frame of my board I chose to use a 1x2x8" pine board. You will only need 1. My first 2 cuts were the length of my longer sides... 22".

## STEP 2

I used Gorilla Wood Glue and my Ryobi Finish Nailer to attach both pieces.

Now your final two pieces will the length shown on the right.

I would encourage you to measure your own before cutting. Some wood is slightly off on measurement, and this just makes sure you are cutting the length that fits yours best!

That's it for the wood! Super easy!

## STEP 3

Now for the finish... I chose to use one of my very favorites for this project... **Rust-Oleum Wood Stain in Dark Walnut.**

After waiting just an hour for this stuff to dry (LOVE that!) I got started attaching my hardware!

I found these great little silver things at called Pipe Rail Ties. They are \$1.38 a piece at my store... Fits my shanty budget perfectly!

## STEP 4

For my bottle, I used a Archer Farms (from Target) coffee drink bottle. These come in packs of 4. They are just like the Starbucks ones, but the bottle is more round. Plus they were on sale, so I paid under \$1 a bottle...Woohoo! I peeled off the plastic wrapper and washed the bottle out before attaching it to my metal piece.

The bottle fits well inside of the metal piece. Once you use screws to hold it in place, the bottle is very snug and won't go anywhere!

I used wood screws to attach mine. You want to make sure the head of your screws are big enough not to go through the holes of the metal piece, and the screws need to be short enough to not go through the board.

## STEP 5

My final step was adding my cup hooks. I found these silver ones at Target!

I spaced mine 3" apart and about 4" from the top and bottom of the board. I like to use my drill to make a small starter hole, and then just use your hand to turn the cup hooks into place!

Easy peasy!

## STEP 6

My final step... Hanging it up! I just used a sawtooth hanger on the back and hung it from a screw on the wall.

What do you think? So cheap, so easy and SO chic! I hope you love it! I would LOVE for you guys to share this with your friends.

Thanks so much for stopping by!
